

It is made of high quality engineering plastic raw material ABS ,PP and other materials, with the most advanced injection molding machine and our core technology mold, we make the perfect roving bobbin with flexible but workable surface, equal and shine body, which can solve many quality issues. The roving bobbin vibration couldn't be more than 0.3mm and the relative vertical plane of the verticality is not greater than 1.0mm when it runs at speed of 1800r/m. The bottom part of roving bobbin made of special raw material which hard to be ground and also protect spindle parts

The use of high-quality PC, PPS, PPO, ABS, PP and other engineering plastics raw material, the bobbin body is equal and shining. The ring bobbin can work in very high speed even more than 25000 R/min without any vibration. The surface of bobbin can be developed according to the machine and yarn requirements.

Ring bobbin works in blade spindle. we use our core technology to make them working well in high speed even more than 20000 R/M. Our ring bobbin shining, perfect taper inside, no vibration, catching the spindle well and easy to doff, with a number of national patents
